

Trading OS v0.2 Design Report

Date: 2026-07-02

Workflow: os-v0.2-design

Scope: Define how prompts, source selection, outputs, and browser-readable reports work together.

1. Executive Summary

The first scaffold was useful as a file structure, but it was not strict enough about prompt quality, source selection, and output storage. Version 0.2 upgrades the system around three principles:

- 1. Prompts must be source-aware.
- 2. Workflows must produce one readable report, not many scattered outputs.
- 3. Every completed run must be saved as Markdown, rendered to HTML, and archived as PDF.

2. What Changed in v0.2

Area	v0.1 issue	v0.2 fix
Prompt quality	Prompts were organized but not strict enough	Added source-aware prompt contracts and quality checks
Source usage	Data-source policy was not central enough	Added <code>source_registry/source_matrix.md</code>
Output storage	Output pattern was described but not enforced	Added <code>runs/</code> convention and renderer
Browser access	Needed a way to avoid local download clutter	Added GitHub Pages publishing workflow
Review loop	Improvement loop was conceptual	Added retrospective and prompt-review module

3. Operating Model

```
user input + source matrix
-> prompt module
-> workflow report
-> runs/YYYY/YYYY-MM-DD/<workflow>/report.md
```

```
-> generated report.html and report.pdf
-> site/index.html browser index
```

4. Report Output Contract

Every workflow should create this folder shape:

```
runs/YYYY/YYYY-MM-DD/<workflow-name>/report.md
runs/YYYY/YYYY-MM-DD/<workflow-name>/report.html
runs/YYYY/YYYY-MM-DD/<workflow-name>/report.pdf
```

report.md is the source of truth. report.html is the browser-readable version. report.pdf is the archive/shareable version.

5. Prompt Modules Added

Module	Purpose
P00 Master Report Contract	Universal report structure and quality bar
P01 Daily Context Brief	Daily event/context summary
P02 Weekly Context Review	Weekly calendar and broad-context review
P03 Portfolio Snapshot Review	User-provided snapshot quality and exposure review
P04 Security Research Note	Company/ticker research note
P05 Chart Context Review	Chart-context documentation
P06 News and Catalyst Review	News/materiality review
P07 Event Prep	Scheduled-event preparation
P08 Options Overlay Scenario Review	Educational options-scenario review
P09 Pre-Action Memo	Written reasoning before meaningful manual action
P10 Red-Team Review	Challenge assumptions and missing evidence
P11 Retrospective and Prompt Review	Improve prompts after completed cycles

6. Source Policy

The source policy is deliberately tiered:

1. Primary or official sources for precise facts.
2. Dashboards for scanning and context.
3. News and commentary for narrative, not as source-of-truth data.

Each report must include `Sources Used` and `Missing Data` sections.

7. Browser Output Path

After merge, enable GitHub Pages with source set to GitHub Actions. Then run the workflow named `Render and publish reports`. It will generate the HTML/PDF outputs and publish the browser index.

8. Current Limitations

- The GitHub connector can create text files, but binary PDF files should be generated by GitHub Actions or locally.
- Some finance-specific wording can trigger connector safety checks, so repo files use research/reporting language and avoid execution instructions.
- This system stores research outputs; it does not automate financial account actions.

9. Next Improvements

1. Add a real daily report using current market sources.
2. Add a real weekly review using a sanitized holdings snapshot.
3. Add stronger examples for each prompt module.
4. Add a prompt changelog and failure log.
5. Enable GitHub Pages after merge.

10. Sources Used

- User requirements from this chat.
- Existing Trading OS scaffold design.
- Source-policy approach discussed in prior analysis.

11. Missing Data

- No live portfolio snapshot included in this sample.
- No live source browsing included in this sample design run.
